

mapping[X], if key exists, value
returned. if key DNE,
X key error

in context of .map() however,
if key DNE, ✓ returns NAN

b/c pandas does:

```
if callable(obj):  
    return func(x)  
elif isinstance(obj, dict):  
    return dict.get()
```

dict.get avoids
key errors w/ nan
