

Function(*col*) OVER (
PARTITION BY *cols*
ORDER BY *col* desc/asc
ROWS BETWEEN CURRENT AND UNBOUNDED FOLLOWING
)

defines a *window function* which lets SQL look at other rows related to the current row, without collapsing rows like GROUP BY does

partition by: splits rows into groups for the window calculation

order by: defines the sequence of rows within each partition

rows between: controls which row relative to the current row are included in the calculation

over: tells SQL this is a window function
